

# AdvancedLive 9.0

## Manage isolations remotely

## What's new in release 9.0?

Based on user feedback, our latest developments bring a new dimension of interaction to AdvancedLive.

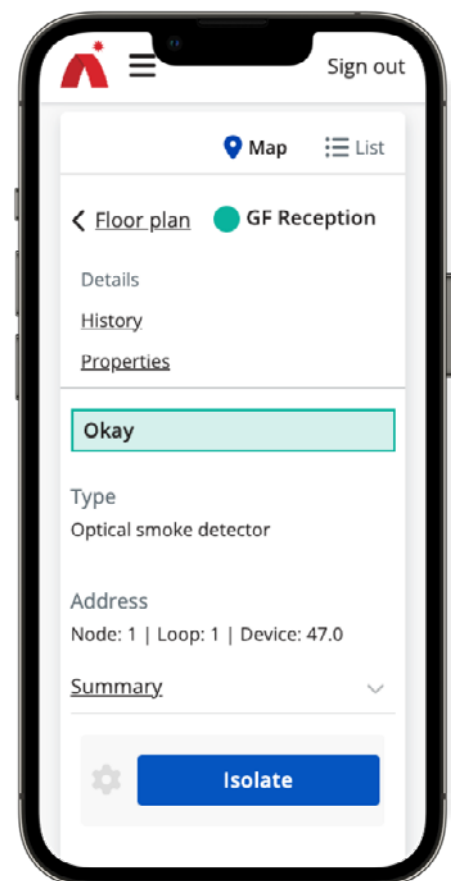

As well as being able to remotely view your fire system to help with fire incidents, you can now use AdvancedLive to actively control and manage parts of the system too.

New time-saving functionality means you can quickly and easily set and end isolations on your chosen devices without needing to be at the panel. Clear visual representation of enabled and isolated devices on the AdvancedLive dashboard provide clarity over actions taken and full awareness of system status – for complete peace of mind.

You can also access a comprehensive audit of users who set/ended isolations for full accountability.

As ever with AdvancedLive, it's up to the responsible person to set the user permissions for this functionality, so you can be confident you're in control of your system.

We're developing many more ways for you to remotely operate and interact with your fire system – watch out for future releases!

### Release 9.0 brings you other benefits too:

Following a fire incident, you can now see a full audit of actions taken, by whom, in the incident timeline and device history.

When you're viewing device details, it's now easier to understand status and location.

To experience the changes, log in to your AdvancedLive account, contact your sales representative or email [enquiries@advancedco.com](mailto:enquiries@advancedco.com)
